View Cookie Policy. Bosch are a major player in the appliance industry and enjoy a considerable share in the dishwasher market. They are generally very reliable however unfortunately things can sometimes go wrong and you will need to troubleshoot and repair your Bosch dishwasher. Dishwashers are actually fairly simple appliances so many problems you can encounter are often fairly simple repairs.

For specific advice about Bosch Dishwasher troubleshooting carry on reading for advice on where to get started in repairing the problem. The method to run this test cycle is similar across the Bosch dishwasher range so if your dishwasher features seem different from those described below then try experimenting, as the process is fairly straightforward and will be very similar. Bosch dishwasher model numbers are usually found around the top or lip of the door. For example in the first example below, POWER SCRUB PLUS and REGULAR WASH may be called WASH and ECO depending on your dishwasher model and the country you are in. The other key difference is whether your dishwasher has a display panel which can display error codes or not in which case a program light will illuminate to tell you the fault. The lights above them should flash. Now you can check the status of each dishwasher program by pressing its button. If this is the case then the test cycle will be very short as the dishwasher will terminate the test once it's been detected. If this is the problem then the test cycle will not complete as the dishwasher cannot detect the right level of water, the dishwasher will just keep filling and draining again. Check your heating element. Our general troubleshooting page will give you some ideas on other things to check on your dishwasher. Good luck! Well assume you're ok with this, but you can opt out if you wish. Accept Read More. Even though parts may look the same, there are often variances in similar parts and it is important to buy parts that fit your specific model. Please try again. instead of a raw data average. The model takes into account factors including the age of a rating, whether the ratings are from verified purchasers, and factors that establish reviewer trustworthiness. Please try again later. Nkap99238 1.0 out of 5 stars Nothing wrong with Amazon or the company who provides this part, Im just ranting at Bosch for making such a poor design decision. I think the proper method is to turn the DW off, then open the door to add the item. Better yet, do not ever open the door while it is in its cycle. I wonder if this switch is available with a metal latch. Assistant Do you plan on doing the work yourself. Customer If we can Assistant Anything else we should know to help you best. Customer I am not sure where the drain pump is on this modelCurrently the dishwasher is workingThe quickest and easiest way to empty the water that has tripped the anti flood is to tip the machine to a 45 degree angle and the water will run out. Have lots of towels and a mop ready as sometimes there is quite a lot of water in the base of the machine. If you can get into the base of the machine you should see a small float switch normally a piece of polystyrene that will float up when water is in it and activate a switch to stop the machine flooding the kitchen. We are checking if we are under warranty and NEFF to come out and look at the machine. ThanksIt may be best as they will be able to remove the machine and check the anti flood devices themselves. If you need any more help feel free to ask. To continue y Draining ok but JustAnswer is not intended or designed for EMERGENCY questions which should be directed immediately by telephone or inperson to qualified professionals. SGV43A03 BuiltIn Dishwasher Pump then keeps going. I have checked the hose and even swapped it round with my washing machine one but this makes no difference. I have cleaned all the filters and taken off the cover to check the propeller as sugested in the instruction manual. But no joy check water light still illuminated and willnot continue with cycle. Help!!

<http://iluvlocalplaces.com/images/canon-printer-access-point-manual.pdf>

I checked the outlet hose and found a blockage. I cleared the blockage and the unit pumped the water clear. Thanks Steve But I would like to check that the waste water pump isnt blocked before dismantling the controll panel. Could you describe how to access the pump to check it out. Thanks. Rogspeed Its just out of warranty and now the cup saucer light flashes and the water pump is continuing to pump even though there is no water. The dish washer wont start. What is the problem. I think the flashing cup saucer light is reporting a fault. If I know what the fault is for example faulty relay or pump then I can replace it. Can you help me with this one. Is there a service manual I

probably can get my hands on. If there is water on the bottom pan, wipe it up with a towel or so, and the machine should be like new again. Good luck. I ran the selftest and it gave me the fault code 4 which indicates a filling fault. The washer is empty and all wash cycles display the correct number of minutes for the cycle. It counts down to 0, but the pump continues to run. Does this indicate a stuck float, or is the problem with the control board. Where is the float located. I've done some searching, but haven't found any. R I had a similar problem recently. First, there were a few floods. Then, the Bosch only drained nonstop. Even when I used the Cancel Drain buttons the drain pump would run without stopping. When I. The machine has just remained idle since. I believe Or is there a whole The tech should have seen the leak with ease. Replacing the PCB was uncalled for. Regarding the leak, I would gather the pr. All usual methods tried e.g. cleaning strainers and filters, turning power off for a while etc. Finally, while lights are working, the machine makes no noise at all when a program is selected. There is clicking noise, and I can nudge the dial and it will move. I removed the tstat there was a white substance between it and the door what is that, but don't know how to check it.

Am I checking for continuity Thanks much. Roger There is an F14 fault. I have cleaned the arms removed the waste basket from the bottom of the dishwasher and removed the two parts one with the large metal ball to expose the plastic wheel clog. There does not appear to be a blockage. I also removed the top arm and cleaned that out. I don't know what other inlets to check as the guide does not tell me exactly what an F14 fault is but explains F11,12,13. Can you help I have checked and replaced the water valve, check the float and float switch. The handle is working correctly. The selector panel is all electronic and I do not know what else to do to trouble shoot. Total cycle time is far greater than the displayed time and the water doesn't appear to be getting hot. Is there a wiring schematic available so I can check the voltage to the heater to confirm it's the heater that's the problem before I purchase spares. Also, if I need to change the heater Is there any guidance anywhere Checked voltage at controller board inlet solenoids are getting 120V intermittently. I found online that this is the behavior for fault code f12. I have all of the service manuals for Miele products. I am factory auth. for service on Miele. Continuity check on heater element o.k. one side disconnected from voltage wire. Any ideas If either end of the element reads to the chassis the element is bad. It is possible to read end to end. The middle wash arm in the dishwasher underneath the top tray does not seem to be spinning resulting in dirty glassware etc. I have checked the arm for debris which is clear and clean. The only thing I can think of is there is not enough pressure being pushed through the pipe from the back of the machine. Unfortunately I do not know where to go from here Please help! Paul It could ultimately be a worn out wash. I've checked the plug, outlet, breaker, etc.

www.thelawchamber.com/wp-content/plugins/formcraft/file-upload/server/content/files/1626c5dcc217bc--8564ec-user-manual.pdf

I know there is a way to reset the keypad by holding down a couple of buttons at the same time, but I can't remember the right combination or how I learned it in the first place. It's not in the user's manual. Power is 120VAC at outlet to DW when disconnected but the voltage is 60VAC at junction box under DW once it connected. Could find no solution in the useless instruction manual. The drain pump runs continuously, even though there is no water inside, I poured water in with a kettle and it does drain correctly. After a short while fault code AL01 appears. Any ideas I tested the voltage going to the heating element and got a 124V reading. However the dishes are still soaking wet after the drying cycle. What am I missing, what else could be wrong with the machine that the dishes won't dry at all Water temperature should be between 120 and 140 F. If water is not hot enough then heating element has gone bad, to check the element you'll have to manually switch it off. Any ideas before I call out an engineer. I have checked all the filters etc included in the troubleshooter info and there are no blockages. I have checked the power up to the control panel. An earlier posting said to

replace the thermal fuse. I don't have a wiring diagram so I don't know where to locate it or what it looks like. Thanks David This could be a power surge or element failure. This fuse is mounted in close proximity to the main board. Both parts are housed within the control panel. The actu.
